# Volume Delineation: Methods to use

T. Weitzel

# Volume Delineation

# Volume ??

# Volume !

Implicit assumptions:

- some **inside**
- some **outside**
- some **surface**

# Volume !

Implicit assumptions:

- some **inside**
- some **outside**
- some **surface**

Needs **criterion** to distinguish inside from outside

# Volume !

Implicit assumptions:

- some **inside**
- some **outside**
- some **surface**

Needs **criterion** to distinguish inside from outside

e.g.: „inside the skull“

geometric argument, very well defined surface,  
but not a simple criterion describing the things inside

b.t.w.: Are the eyes “inside” the skull ?

# Volume !

Implicit assumptions:

- some **inside**
- some **outside**
- some **surface**

Needs **criterion** to distinguish inside from outside

e.g.: „compact object with high X-ray attenuation“

Simple, single valued, measurable property.

Threshold value defines points that are inside.

e.g.: „compact object with high X-ray attenuation“

Simple, single valued, measurable property.

Threshold value defines points that are inside.

Example: Two threshold values allow to distinguish  
 $D(\text{bone}) > T1 > D(\text{markers}) > T2 > D(\text{towel})$

# Volume !

Implicit assumptions:

- some **inside**
- some **outside**
- some **surface**

Needs **criterion** to distinguish inside from outside

e.g.: „**higher accumulation of FDG**“ (PET)

Single threshold value defines points that are inside.

Method of measurement has to be very well defined:  
A Time-Activity-Curve and other parameters are involved.

44

43

e.g.: „higher accumulation of FDG“ (PET)

Single threshold value defines points that are inside.

Method of measurement has to be very well defined:  
A Time-Activity-Curve and other parameters are involved.

# Volume !

Implicit assumptions:

- some **inside**
- some **outside**
- some **surface**

Needs **criterion** to distinguish inside from outside

e.g.: „characteristic properties of TAC“ (PET)

Points whose measured Time-Activity-Curve shows certain properties are regarded inside.

There is a indefinite range of mathematical possibilities to describe and evaluate such properties.

e.g.: „characteristic properties of TAC“ (PET)

Points whose measured Time-Activity-Curve shows certain properties are regarded inside.

There is a indefinite range of mathematical possibilities to describe and evaluate such properties.

# Volume !

Implicit assumptions:

- some **inside**
- some **outside**
- some **surface**

Needs **criterion** to distinguish inside from outside

e.g.: „Multi-modal imaging“ („multi-spectral“ MRI)

Points show a vector of measured values.

There is a indefinite range of mathematical possibilities to define properties in a multidimensional vector-space.

distinguish

e.g.: „Multi-modal imaging“ („multi-spectral“ MRI)

Points show a vector of measured values.

There is a indefinite range of mathematical possibilities to define properties in a multidimensional vector-space.

# Volume Delineation

**but now ...**

**... back to the roots !**

# Illustration using „Phantom“-Data

# Illustration using „Phantom“-Data

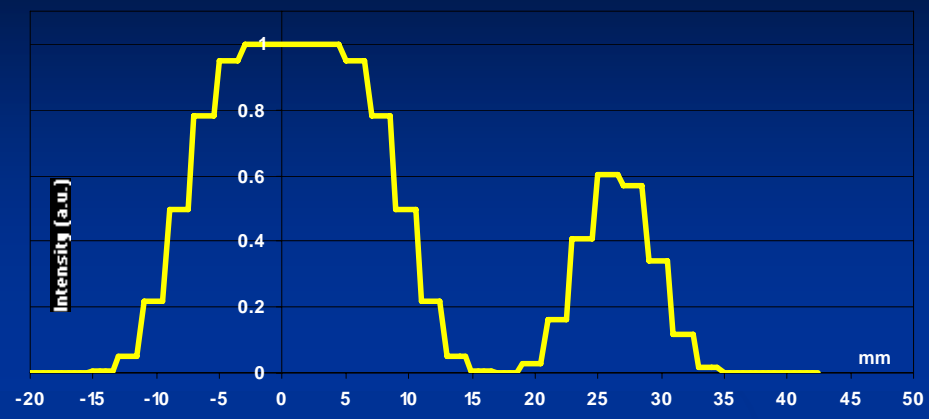

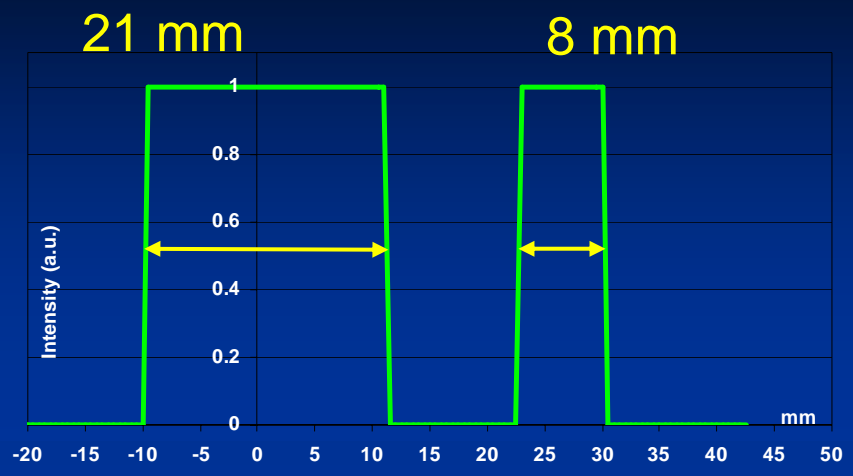

# Determining Intensity

Imaging:

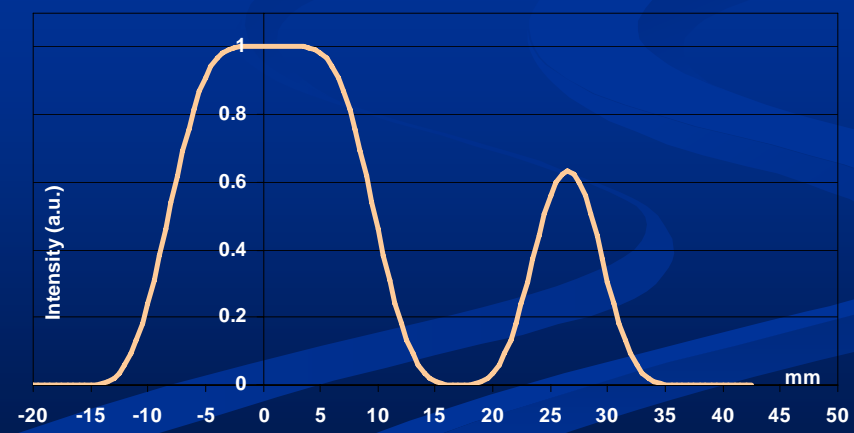

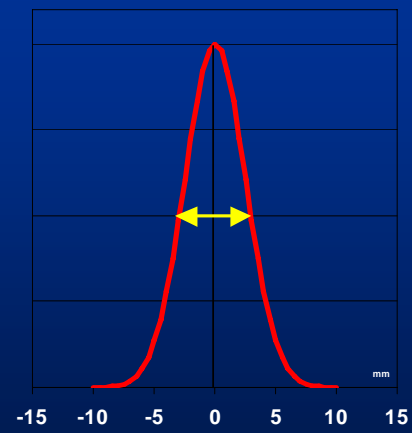

# Object

# Image

Convolution + Sampling

Transfer Function  
FWHM ca. 5.5 mm

# Determining Intensity

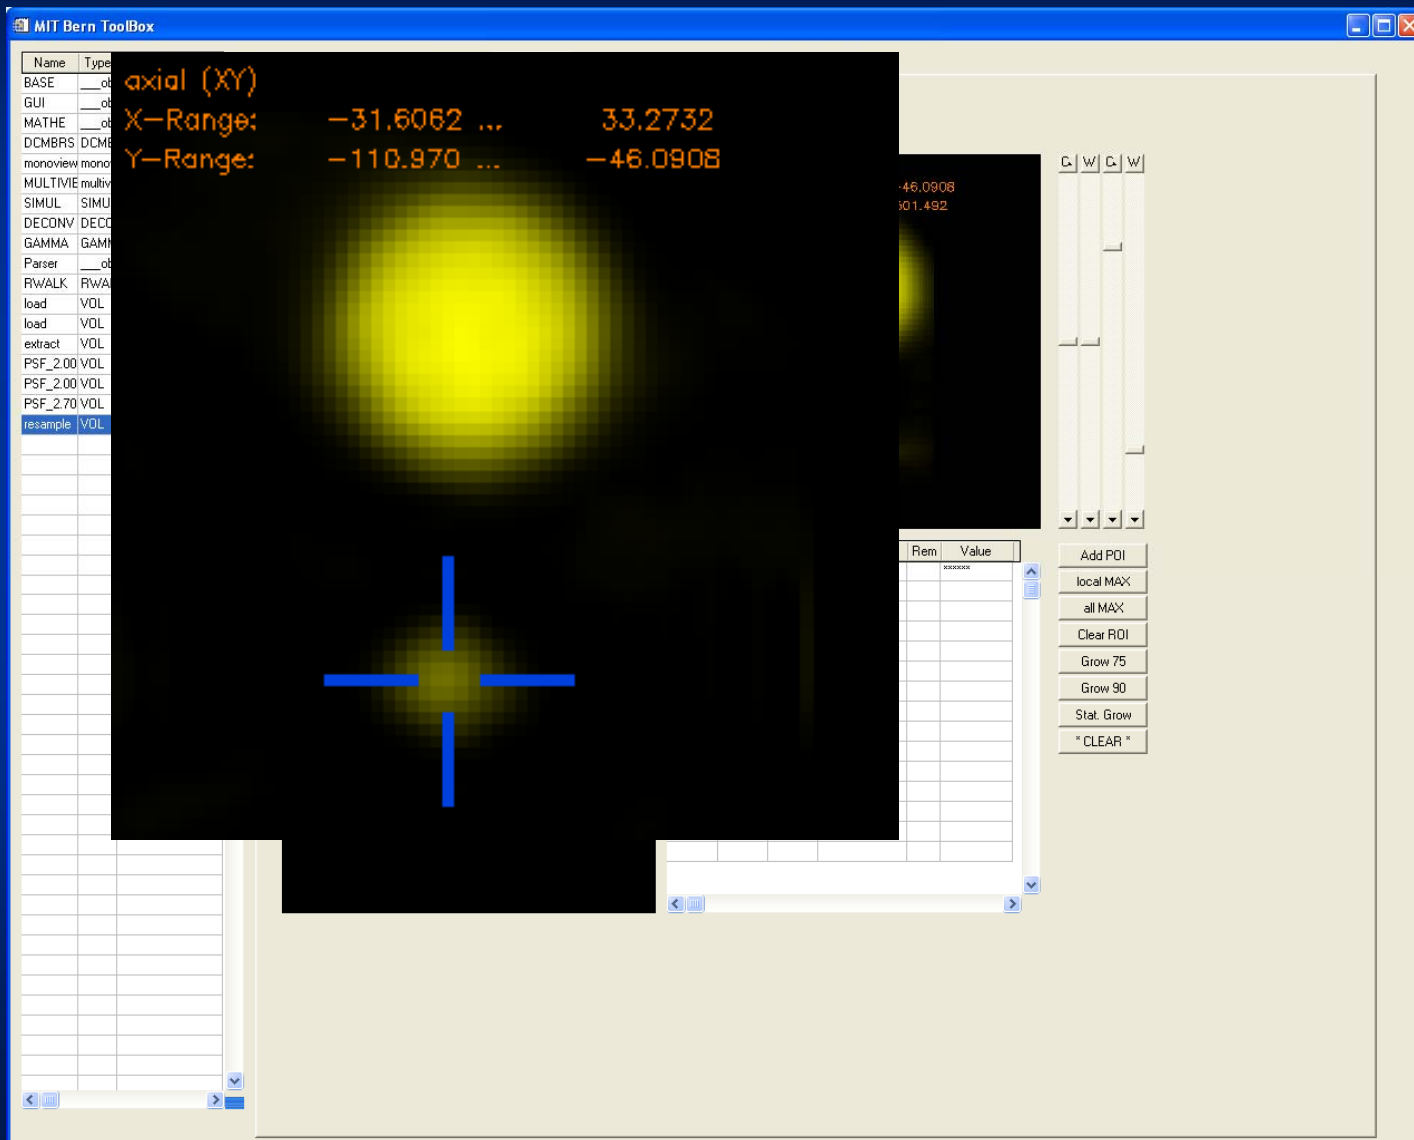

Intensity: 4 Voxel reach (almost) full intensity  
-> define as ROI and calculate average to determine original intensity ...

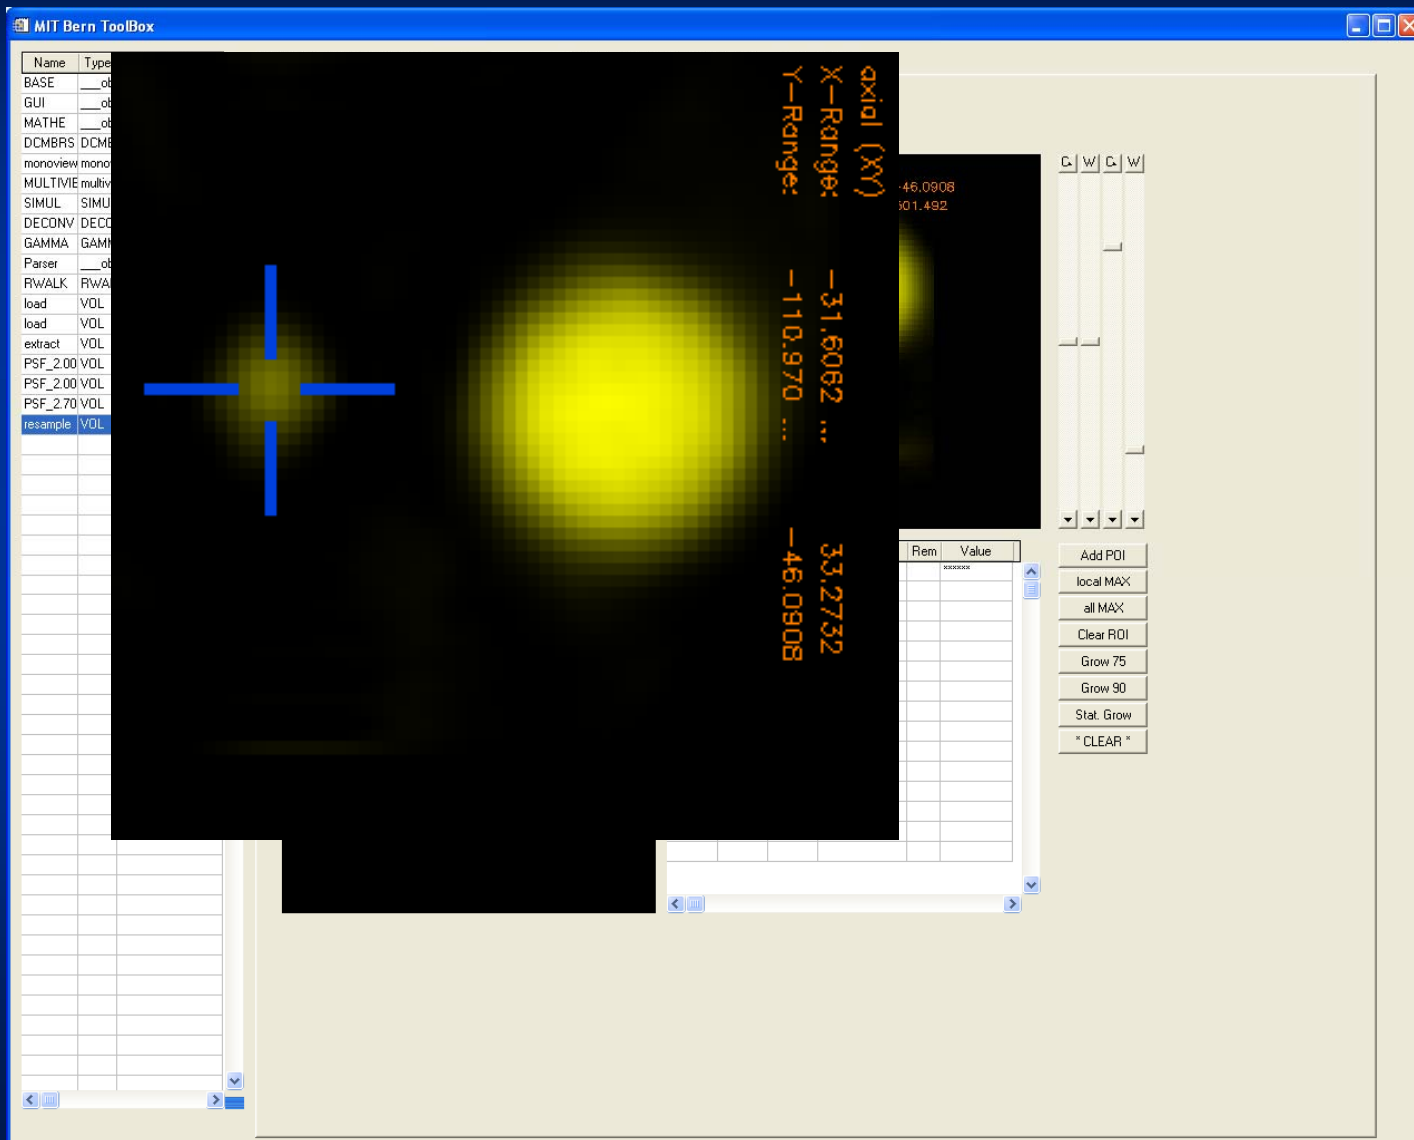

Partial volume effect: Intensity „leaks out“ to neighbouring Voxels  
in 3 dimensions (!) but is not lost at all ...

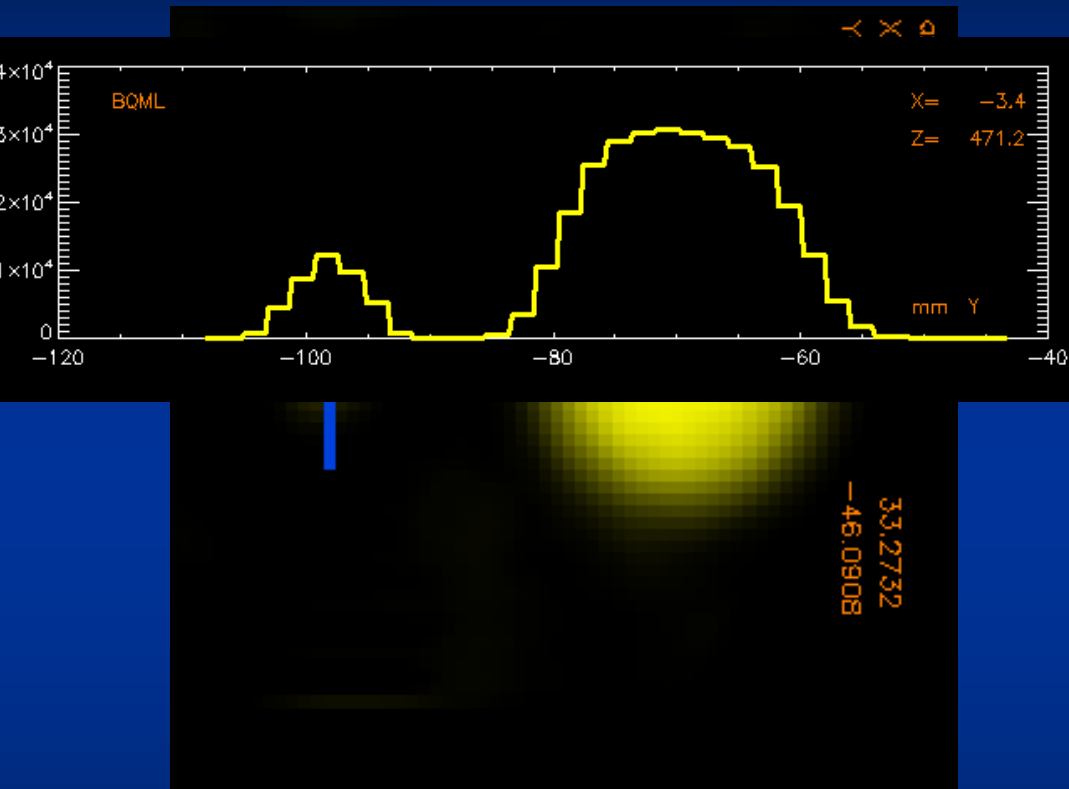

# Measurement

(Resampling)

+

**Deconvolution**

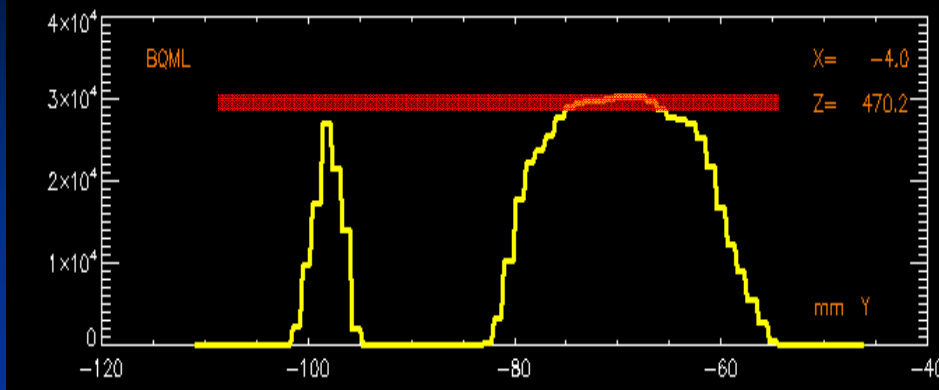

**Transfer Function**  
FWHM ca. 5.5 mm

# Determining Intensity

Remark:

In fact the model just shown  
is wrong.

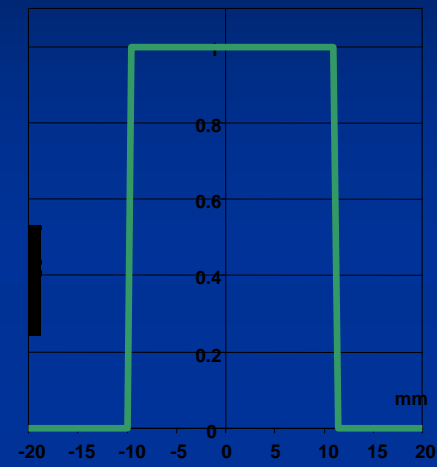

A PET using iterative reconstruction algorithms,  
CT based attenuation correction,  
superresolution algorithms and  
methods to correct for scatter ...

... does not have a stable transfer function.

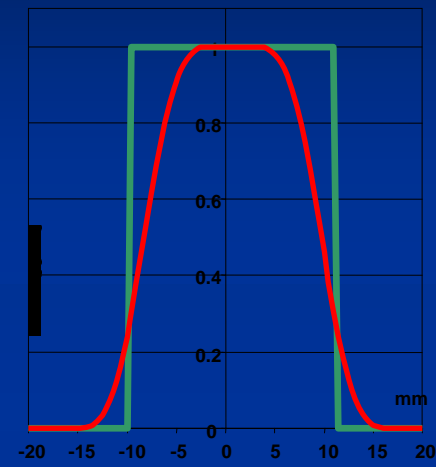

**But it looks like it would have ...**

# Object,

# Object, Convolution,

# Object, Convolution, Noise,

# Object, Convolution, **Noise**, Sampling...

-> Signal

# Region Growing conventional

- 1: choose a point within Region of Interest
- 2: „grow“ by including all neighbors with (e.g.) Intensity > 80%

# Region Growing conventional

- 1: choose a point within Region of Interest
- 2: „grow“ by including all neighbors with (e.g.) Intensity > 80%

=> (-) result depending on arbitrary starting point

=> (-) not suitable for very small regions

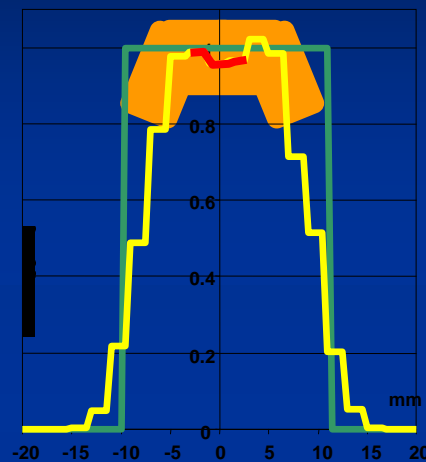

# Region Growing, statistical, local

- 1: choose a point within Region of Interest
- 2: „grow“ by including all neighbors having a „flat“ environment (e.g.) standard deviation in local surrounding below a limit

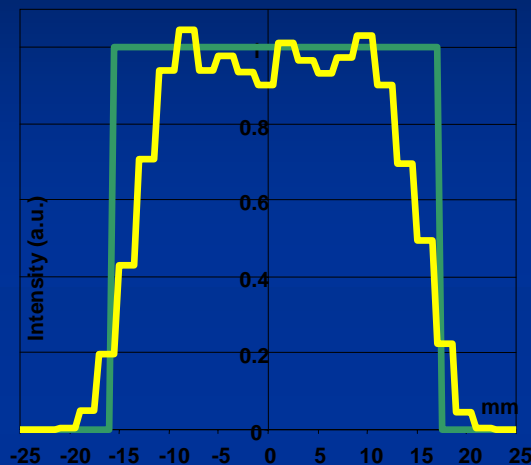

# Region Growing, statistical, local

- 1: choose a point within Region of Interest
  - 2: „grow“ by including all neighbors having a „flat“ environment (e.g.) standard deviation in local surrounding below a limit
- => ( + ) result does not depend on starting point
  - => ( - ) border of area is missing
  - => ( - ) tendency to grow out of ROI via potential „smooth“ pathways

# Region Growing, statistical, full region

- 1: choose a point within Region of Interest
- 2: „grow“ by including neighbors if the overall variance of the total resulting new region stays within given limit.

# Region Growing, statistical, full region

- 1: choose a point within Region of Interest
- 2: „grow“ by including neighbors if the overall variance of the total resulting new region stays within given limit.

=> ( + ) result does not depend on arbitrary starting point

=> ( + ) process includes the „bordersurface“  
i.e. even very small regions are captured

Reg.Grow

Stat.Grow  
„0.05“

## Volume Delineation:

The simple case:

- More or less homogeneous region of interest ...
- .. inside of another more or less homogeneous region
- Region is big compared to spatial resolution and sampling period,  
i.e. combined volume of „surface voxels“ is small compared to total volume of region of interest.
- Measured values inside region show a significant difference to values outside

**Use one of the standard methods:**

**Select a Voxel inside,**

**then region growing using a suitable threshold**

# Volume Delineation:

The not so simple case:

## Volume Delineation:

The not so simple case:

- Low spatial resolution

## Volume Delineation:

The not so simple case:

- Low spatial resolution
- Low signal to noise

## Volume Delineation:

The not so simple case:
